1.4

1. Claims 1-20 are presented for examination.

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office Action.

## Response to Arguments

- Applicant's arguments filed on 4/11/2005 have been fully considered by they are not persuasive.
- 4. As per remarks, Applicant argued that (1) Boucher does not show associating each fragment to an underlying link of the aggregate on the basis of an Internet protocol (IP) identifier (ID) of each datagram and a number of active links of the aggregate.
- As to point (1), Boucher teaches associating each fragment to an underlying link of the aggregate on the basis of an Internet protocol (IP) identifier (ID) of each datagram and a number of active links on the aggregate (Paragraph [0052] "... as packet bytes pass through the hardware, by categorizing selected header bytes. Results of processing the selected bytes help to determine which other bytes of the packet are categorized... The processed headers and data from the received packet are then stored..."; Paragraphs [0057-0058]; Paragraph [0073] "... INIC is connected with four network lines... transport data along a number of different conduits..."; Paragraph [0109] "... processing TCP/IP data... reassemble IP fragments. ... holds information about status of the IP reassembly... across the IP datagram... identified by the IP ID of the

datagram..."; Paragraph [0332]; Paragraph [0502] "... associated with an input frame when the frame's source and destination IP addresses and source and destination ports match that of TCB...the link is dynamic on a per-frame basis...").

## Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

- 7. Claims 1, 9-11, and 16 are rejected under U.S.C. 102(e) as being anticipated by Boucher et al. (hereinafter Boucher) US 2001/0027496.
- 8. As per claim 1, Boucher teaches a method for uniformly distributing data transmitted by a server over a plurality of underlying links of an aggregate within a computer network comprising:

defining a unit of data as a datagram (Paragraph [0109]);

Art Unit: 2154

apportioning each datagram into at least one fragment at the server (Paragraphs [0067], [0070], [0110] and [0112]);

associating each fragment to an underlying link of the aggregate on the basis of an Internet protocol (IP) identifier (ID) of each datagram and a number of active links of the aggregate (Paragraphs [0052], [0057-0058], [0073], [0109], [0332] and [0502); and transmitting the fragment over its associated underlying link from the server to the computer network (Paragraphs [0008], [0048], [0049] and [0065]).

 As per claim 9, Boucher teaches the method of claim 1, further comprising: loading at least one data buffer of the server with the at least one fragment (Paragraph [0071]);

fetching the fragment from the data buffer (Paragraph [0071]); and loading at least one queue of the server with the fragment, the queue associated with the underlying link (Paragraphs [0042], [0053] and [0083]).

10. As per claim 10, Boucher teaches a system adapted to uniformly distributing data over a plurality of underlying links of an aggregate within a computer network, comprising:

a processor (Paragraph [0049]);

a memory coupled to the processor and having locations addressable by the processor (Paragraph [0049]);

an operating system resident in the memory locations and executed by the processor, the operating system configured to implement a modified load balancing technique that defines a unit of data as a datagram, the operating system comprising an

Internet Protocol layer (IP) that apportions the datagram into at least one fragment, the operating system further comprising a virtual interface process that associates the fragment to an underlying link of the aggregate on the basis of an IP identifier (ID) of the datagram and a number of active links of the aggregate (Paragraphs [0010], [0011], [0109], [0112], [0276] and [0462]); and

at least one network adapter coupled to the memory and processor that cooperates with a network driver of the operating system to transmit the fragment over the associated underlying link to the computer network (Paragraphs [0048], [0049], [0276] and [0462]).

11. Claims 11 and 16 do not teach or define any new limitations above claim 1 and therefore is rejected for similar reasons.

#### Claim Rejections - 35 USC § 103

- 12. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 13. Claims 2, 3,12, 13, 17 and 18 are rejected under U.S.C. 103(a) as being unpatentable over Boucher et al. (hereinafter Boucher) US 2001/0027496, in view of Takagi, Masahiro (hereinafter Takagi) US 2001/0036154.

- 14. As per claim 2, Boucher does not explicitly teach the method of claim 1 wherein the step of associating comprises the step of producing a result representing a remainder upon dividing the IP ID by the number of active links.
- 15. Takagi teaches the method of claim 1 wherein the step of associating comprises the step of producing a result representing a remainder upon dividing the IP ID by the number of active links (Paragraph [0058]).
- 16. It would have been obvious to one of ordinary skill in this art at the time of invention was made to combine the teaching of Boucher and Takagi because they both deal with transmitting a datagram over a network and associating each fragment to an active link accordingly. The teaching of Takagi is to divide the TCP/IP packet into a plurality of link layer frames, which is a representation of the number of active links available. Takagi discloses the frame formation is for the non-transmitted packets of the TCP/IP connection, which is viewed as the remainder. Furthermore, the teaching of Takagi to produce a result representing a remainder upon dividing the IP ID by the number of active links would improve the functionality of Boucher's method by allowing for each datagram fragment to be transferred simultaneously and individually along distinct underlying links.
- 17. As per claim 3, Boucher teaches the method of claim 2 wherein the step of associating further comprises:

calculating the IP ID of each datagram in a sequential manner (Paragraphs [0091],[0109] and [0564]); and

rotating the fragments of each datagram among all the underlying links to thereby ensure that all fragments having the same IP ID are provided to the same physical link of the aggregate (Paragraphs [0005] and [0561]).

- 18. Claims 12 and 17 do not teach or define any new limitations above claim 2 and therefore is rejected for similar reasons.
- 19. Claim 13 and 18 do not teach or define any new limitations above claim 3 and therefore is rejected for similar reasons.
- 20. Claims 4, 14 and 19 are rejected under U.S.C. 103(a) as being unpatentable over Boucher et al. (hereinafter Boucher) US 2001/0027496, in view of Narad et al. (hereinafter Narad) US 6,157,955.
- 21. As per claim 4, Boucher does not explicitly teach the method of claim 1 wherein the step of associating comprising:

logically combining the IP ID with a predetermined mask to produce a quantity; right shifting the quantity a predetermined number of places; and establishing a threshold at which a group of data is forwarded to each underlying link of the aggregate.

22. Narad teaches the method of claim 1 wherein the step of associating comprises: logically combining the IP ID with a predetermined mask to produce a quantity (Col. 37, lines 2-6; Col. 91, lines 51-56);

right shifting the quantity a predetermined number of places (Col. 42, lines 42-48); and

Art Unit: 2154

establishing a threshold at which a group of data is forwarded to each underlying link of the aggregate (Col. 6, lines 56-62; Col. 8, lines 21-29).

Page 8

- 23. It would have been obvious to one of ordinary skill in the art at the time of invention was made to combine the teaching of Boucher and Narad because they both deal with processing data in-order to transmit information through a network of communication links. Furthermore, the teaching of Narad to combine the IP ID with a predetermined mask, then to right shift the combined value a predetermined number of places while establishing a threshold at which a group of data is forwarded to each underlying link accelerates the association of a datagram and increases efficiency with the system Boucher discloses.
- 24. Claims 14 and 19 do not teach or define any new limitations above claim 4 and therefore is rejected for similar reasons.
- 25. Claims 5, 15 and 20 are rejected under U.S.C. 103(a) as being unpatentable over Boucher in view of Takagi as applied to claims 2, 12 and 17 above, and in further view of Narad.
- 26. As per claim 5, Takagi teaches the method of claim 4 wherein the step of associating comprises the step of producing a result representing a remainder upon dividing Internet Protocol by the number of active links (Paragraph [0058]).
- 27. Takagi does not teach the step of dividing the right shifted logically combined IP ID and predetermined mask by the number of active links.
- 28. Narad teaches a method comprising:

a combined quantity of IP ID and a predetermined mask (Col. 37, lines 2-6; Col. 91, lines 51-56); and

right shifting the combined quantity a predetermined number of places (Col. 42, lines 42-48).

- 29. It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Boucher, Takagi and Narad because they each discuss methods process a datagram or packet in-order to distribute the data over a network through a plurality of links. Furthermore, the teaching of Narad to combine the quantity of the right shifted IP ID and predetermined mask in connection with Takagi's teaching to produce a result by dividing the combined quantity by the number of links allows for data to be transmitted more efficiently and uniformly through grouped underlying links within a computer network.
- 30. Claims 15 and 20 do not teach or define any new limitations above claim 5 and therefore is rejected for similar reasons.
- 31. Claims 6-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Boucher, Takagi and Narad, in view of 'Official Notice'.
- 32. As per claim 6, Boucher does not explicitly teach the method of claim 5.
- 33. Narad teaches a predetermined mask in association with Internet Protocol and a predetermined number of right shifted places (Col. 37, lines2-6; Col. 91, lines 51-56; Col. 42, lines 42-48).

Art Unit: 2154

Page 10

- 34. Boucher and Narad do not teach the method of claim 5 wherein the IP ID is a 16-bit value, the predetermined mask is 0xFF80 and predetermined number of right shifted places is 7, and wherein the group of data comprises 128 IP IDs. However 'Official Notice' is taken by the Examiner that Internet protocol identification (IP ID) protocol is well know. It would have been obvious to one of ordinary skill in the art to incorporate lpv6 standards for the 16-bit value of the IP ID. It would be obvious to arbitrarily set the predetermined mask as 0xFF80 because this would justify a standard mask for data transmittal. Also, it would have been obvious to combine the teaching of Narad who discloses a predetermined number of right shifted places to arbitrarily set the number of places to 7. From the number of shifted places, it would be obvious the data comprises of 128 IP IDs where in binary form, 2 to the power of 7, comprises of 128 possibilities, because doing so would increase ID possibilities and improve data transfer efficiency.
- 35. Claim 7 does not teach or define any new limitations above claim 6 and therefore is rejected for similar reasons.
- 36. As per claim 8, Narad does not explicitly teach a method of claim 7 wherein each datagram comprises up to 23 fragments.
- 37. Narad teaches that each IP layer datagram consists of a sequence of IP fragments. 'Official Notice' is taken by the Examiner that User Datagram Protocol (UDP) is well known. It would be obvious to one skilled in the art to arbitrarily set the number of fragments a datagram can be broken into to 23 because this would justify a maximum number fragments to be transmitted over the network of links.

38. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nicholas Martin whose telephone number is (571) 272-3970. The examiner can normally be reached on Monday - Friday 8:30 a.m. - 5:30 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John A. Follansbee can be reached on (571) 272-3964. The fax phone number for the organization where this application or proceeding is assigned is 571-273-3970.
